Outline

1 Questions and answers

1.1 Comments to introductory test

Question 1

1 Why deciduous plants take off their leaves?

1. To prevent freezing
2. **To prevent drying**
3. To get rid of poisonous chemicals

Question 2

2 Where does human digestion process start?

1. **In the mouth**
2. In the intestines
3. In the stomach

Amylase and lipase

Question 3

3 Which birds do NOT live in Minot on winter?

1. Crows
2. **Hummingbirds**
3. Sparrows

Question 4

4 Home country of watermelon:

1. Central America
2. Canada
3. **South Africa**

Question 5

- 5 Why do insectivorous plants eat insects?
1. **To obtain the lacking mineral resources**
 2. To get an addition to their common “menu”
 3. To get rid of herbivores

Question 6

6 Which insects have no queen?

1. Bumblebees
2. Ants
3. **Cockroaches**

Bumblebees

Question 7

7 Oak tree is pollinated by:

1. **Wind**
2. Bees
3. Flies

Oak flowers

Question 8

8 Spider has:

1. 6 legs
2. **8 legs**
3. 4 legs

Question 9

9 Apple flower has:

1. **5 petals**

2. 4 petals
3. 3 petals

Question 10

10 Frightened man has:

1. **Bigger pupils**
2. Smaller pupils
3. Normal pupils

Question 11

11 Polar bears are not eating penguins because:

1. Penguins run very fast
2. **They cannot meet**
3. Penguins are poisonous for bears

 POLAR BEAR DISTRIBUTION (approx.)

12 How many toes are on each of cat's hind legs?

1. 5
2. 4
3. 3

Question 13

13 Pineapple is a:

1. Tree
2. Shrub
3. **Herb**

Question 14

14 If somebody has an artery cut on the arm or leg, it is recommended:

1. Put a tight bandage below the cut
2. **Put a tight bandage above the cut**
3. Do nothing

Question 15

15 Which of the following is the most precise statement?

1. We are breathing to support our life
2. **We are breathing to obtain the energy from food**
3. We are breathing to have enough strength for food consuming

Question 16

16 Which tree is better to plant in Minot house backyard:

1. Sycamore

2. **Ash**

3. Yew

Question 17

17 Moles eat:

1. **Worms**

2. Roots

3. Frogs

Question 18

18 Which fish gives birth to the fully developed offspring?

1. Sturgeon

2. **Shark**

3. Flounder

Question 19

19 Which human organ lives longer?

1. **Heart**
2. Lungs
3. Brains

Question 20

20 Which plant normally has a longer root?

1. Spruce
2. **Chokecherry**
3. Blueberry

Fallen

spruce tree

1.2 Importance of Plants

Importance of plants

Why are plants important?

- Food
- Oxygen
- ...?

[aesthetics, landscape, materials, drugs,...]

2 Plants: definition

2.1 Plants₁ and plants₂

Plants₁ and plants₂

- Plants₁ are all green photosynthetic organisms
- Plants₂ are “typical plants” (better definition follows)

The nature of two definitions

- Plants₁—ecological definition (based on the role in nature)
- Plants₂—taxonomic definition (based on the evolution)

Plants₁ is about ecology

Plants₁ are *photosynthetic organisms*:

Some plants₁ could taxonomically be bacteria or even animals!

Green slugs

Green slugs obtain chloroplasts from algae, but keep them all their life, feed from them and even use chloroplast genes.

Green *Hydra*

No mouth!

Plants₁ and plants₂ are similar but not the same

Final question (2 points)

What is the difference between plants₁ and plants₂?

Summary

- “Plants” have **two definitions**

For Further Reading

References

- [1] A. Shipunov. *Introduction to Botany* [Electronic resource]. 2016. Mode of access: http://ashipunov.info/shipunov/school/biol_154

Outline

3 Questions and answers

3.1 Quiz

Quiz

What is the difference between plants_1 and plants_2 ?

Plants_1 and plants_2 are similar but **not** the same

4 Plants in general

4.1 Green slug, spruce and full plant parasites

Hydnora

Root parasite

Pilostyles

Tissue parasite

Dodder

Stem parasite

5 Plants in general

5.1 Levels of organization

Levels of organization

- Ecosystems OR Taxa
- Populations
- Organisms
- Organs
- Tissues
- Cells
- Organelles
- Molecules

Place of botany

Layered cake of biology (Odum, 1971): botany is a “slice science”

5.2 Taxonomy

Ranks

Most scientists accept seven main ranks:

- Kingdom
- Phylum
- Class
- Order
- Family
- Genus
- Species

Names

- Names of species are binomials like *Solanum tuberosum* (potato)
- Names of other ranks are uninomials like **Vegetabilia** (plant kingdom)

Pyramid of life

Questions about pyramid

What is Monera? Prokaryotes: (1) Bacteria and (2) Archaea

What is Protista? Eukaryotes without tissues

Where are eukaryotes? Protista, Vegetabilia and Animalia

Where are fungi? They belong to different protists

Where are plants₂? Vegetabilia

Where are plants₁? Here it is not applicable

Why are two groups on one level? Vegetabilia and Animalia both have tissues but obtained them for the radically different purposes. Animals acquired *kinoblast* and *phagocytoblast* **to hunt and digest**, and plants have *epidermis* and *photosynthetic tissue* **to survive on land**.

Plants₁ and plants₂ (updated)

- Plants₁ are all photosynthetic organisms
- Plants₂ are **Vegetabilia**: multi-tissued, terrestrial, primarily photosynthetic eukaryotes

6 Ways of life

6.1 Energy and food

Ways of life

- How to obtain energy?
 1. From sun light: **phototrophy**
 2. From chemical reactions with inorganic matter (“rocks”): **lithotrophy**
 3. From breaking organic molecules into inorganic (typically, carbon dioxide and water): **organotrophy**
- How to obtain building blocks?
 1. From assimilation of carbon dioxide: **autotrophy**
 2. From other living beings: **heterotrophy**

Six life styles and taxonomy

	Phototrophs	Lithotrophs	Organotrophs
Autotrophs	Plants ₁ : some Monera, some Protista, most of Vegetabilia	Some Monera	Some Monera
Heterotrophs	Some Monera	Some Monera	Majority of Animalia and many Protista and Monera

Plants₁, plants₂ and life styles

- Plants₁ are **photoautotrophs**
- Plants₂ are photoautotrophs too but there are exceptions: **fully parasitic plants**. Formally, many parasitic plants are plants₂ but not plants₁
- Carnivorous plants (like sundew or Venus flycatcher) are all photoautotrophs! They “eat” animals to obtain fertilizers: nitrogen and phosphorous.

Final question (1 point)

Which of plants₂ are not plants₁?

Summary

- Botany is a “slice” science
- “Carnivorous” plants are not carnivores

Outline

7 Questions and answers

7.1 Quiz

Final question (1 point)

Which of plants₂ are not plants₁?

Full parasites.

Please note that there are also *hemiparasites* (“half”-parasites) like *mistletoe*.

8 Basics of life

8.1 Chemistry of life

Very basics of chemistry

- Atoms
 - Protons
 - Neutrons
 - Electrons
- Atomic weight
- Isotopes
- Elements
- Periodic table: rows and columns
- Chemical bonds: ionic, covalent, hydrogen
- Valence and group
- Molecules
- Molecular weight

Final question (2 points)

What is a molecular weight of sulfuric acid, H₂SO₄?

For Further Reading

References

- [1] A. Shipunov. *Introduction to Botany* [Electronic resource]. 2016. Mode of access: http://ashipunov.info/shipunov/school/biol_154

Outline

9 Questions and answers

9.1 Quiz

Final question (1 point)

What is a molecular weight of sulfuric acid, H_2SO_4 ?

98

10 Basics of life

10.1 Chemistry of life

Very basics of chemistry

- Atoms
 - Protons
 - Neutrons
 - Electrons
- Atomic weight
- Isotopes
- Elements
- Periodic table: rows and columns
- Chemical bonds: ionic, covalent, hydrogen
- Valence and group
- Molecules
- Molecular weight

Molar mass, mole and molar concentration

- Molar mass is a gram equivalent of molecular mass
- For example, molecular mass of salt (NaCl) is $23 + 35^1 = 58$ Da. We take “Da” out and replace it with “g” (grams). Therefore, 1 mole of salt is 58 g.
- Every mole contains $6.02214078 \times 10^{23}$ molecules (Avogadro’s number)
- Concentration is the density of dissolved substance
- In water solution, 1 M (1 molar) concentration of salt means that in 1 liter of distilled water 58 g of salt was diluted
- If we take half of this water, concentration will still be 1 M whereas amount of diluted salt will decrease twice

Water with hydrogen bonds

¹If we accept that atomic mass of chlorine is 35.

Acids and bases. Ions

- Acids: take out H^+ cation (proton), like
 $\text{HCl} \rightarrow \text{H}^+ + \text{Cl}^-$
or
 $\text{H}_2\text{SO}_4 \rightarrow 2\text{H}^+ + \text{SO}_4^{2-}$
- Bases: take out OH^- anion (hydroxyl)
 $\text{NaOH} \rightarrow \text{Na}^+ + \text{OH}^-$

Concentration of protons, and pH and acidity

- If concentration of protons is 0.1 M (1×10^{-1} , 0.1 g of protons in 1 l of water), this is an extremely acidic solution
- In distilled water, concentration of protons is equal to 1×10^{-7} (0.0000001) M
- This is because water molecules can (rarely) dissociate: $\text{H}_2\text{O} \rightarrow \text{H}^+ + \text{OH}^-$
- pH of distilled water is equal to $-\log(10^{-7}) = -(-7) = 7$
- pH of the extremely acidic solution (first example) is 1

10.2 Molecules of life

Organic chemistry: chemistry of carbon

- Carbon skeleton
- And H, O, N, P, S

Four types of biomolecules

- Lipids: hydrophobic
- Carbohydrates (sugars): multiple $-\text{OH}$ groups
- Amino acids: N + C + O and hydrogen
- Nucleotides: cycle with nitrogen (heterocycle), sugar and phosphoric acid

Final question (2 points)

How do you characterize water with pH= 5?

Summary

- Most important bonds: polar and non-polar covalent (intramolecular) and hydrogen (intermolecular)
- Main biogenic elements: C, H, O, N, P
- Most important monomers: lipids, carbohydrates, amino acids, nucleotides
- Most important polymers: polysaccharides, proteins, nucleic acids

For Further Reading

Outline

11 Questions and answers

11.1 Quiz

Final question (1 point)

How do you characterize water with pH= 5?

- Acidic
- Concentration of protons (H^+) is 10^{-5} which is 100 more than concentration of protons in the distilled water (10^{-7})

Excursion?

12 Basics of life

12.1 Molecules of life

Organic chemistry: chemistry of carbon

- Carbon skeleton
- And H, O, N, P, S

Four types of biomolecules

- Lipids: hydrophobic
- Carbohydrates (sugars): multiple $-OH$ groups
- Amino acids: N + C + O and hydrogen
- Nucleotides: cycle with nitrogen (heterocycle), sugar and phosphoric acid

Carbohydrates

Organic polymers

- Polymeric carbohydrates: polysaccharides (like cellulose and starch)
- Polymeric amino acids: proteins
- Polymeric nucleotides: nucleic acids (DNA and RNA)

Cellulose

(a)

(b)

Summary

- Most important bonds: polar and non-polar covalent (intramolecular) and hydrogen (intermolecular)
- Obligatory biogenic elements: C, H, O, N, P
- Most important monomers: lipids, carbohydrates, amino acids, nucleotides
- Most important polymers: polysaccharides, proteins, nucleic acids

13 Photosynthesis

13.1 History of photosynthesis studies

van Helmont

- Johannes van Helmont (17th century) rejected the idea that plants take most of their biomass from soil
- Willow (*Salix* sp.) tree of 2.27 kg grew to 67.7 kg in five years, but weight of soil decreased only by 57 g
- van Helmont concluded that plants take most of their weight from water

Pristley

- Famous Joseph Pristley in 1772, made series of experiments with mouse, candle and sprig of mint (*Mentha* sp.)
- Mouse behave similar to candle, they both “spent” air
- Plant revives the air for both candle and mouse

Further history

- Jan Ingenhousz (1779–1796) and Jean Senebier (1780) found that:
 - Only in day time the air is reviving
 - CO₂ is assembled
- Antoin-Laurent Lavoiser (1783) found that the “revived air” is a separate gas, **oxygen**

Engelmann

- Thomas Engelmann in 1884 found that *Spirogyra* alga produce oxygen mostly in blue and red parts of spectrum
- Therefore, the key photosynthetic pigment should accept blue and red rays and reflect green rays
- Chlorophyll fits best to this description

Experiment of Engelmann

Blackman

- In 1905, Frederick Blackman discovered that if light intensity is low, increase of temperature has a little effect on the rate of photosynthesis
 1. If light and temperature were *independent*, this could not happen
 2. If temperature and light were *components of the chain*, than light was first and temperature second
- Consequently, photosynthesis has two stages:
 1. Light stage which relates more with light intensity
 2. “Dark” (now called *enzymatic*) stage which relates more with temperature

Light and enzymatic (“dark”) reactions

- Light reactions depend on the light and water, they produce oxygen and energy (in form of ATP)
- Enzymatic reactions depend on carbon dioxide and water, they take energy from light reactions and result in production of carbohydrates

Final question (2 points)

Why did Engelmann decide that photosynthetic pigment has a green color?

Summary

- From 17th century, it constantly became clear that plants make their biomass from light, water and carbon dioxide
- **Photosynthesis** is a sum of light-dependent and light-independent reactions

For Further Reading

References

- [1] A. Shipunov. *Introduction to Botany* [Electronic resource]. 2016. Mode of access: http://ashipunov.info/shipunov/school/biol_154

Outline

14 Questions and answers

14.1 Quiz

Final question (1 point)

Why did Engelmann decide that photosynthetic pigment has a green color?

- Because he saw that oxygen-loving bacteria are concentrating only in places where red and blue light present. It means that pigment of question accepts blue and red so it is green.
- In other words: photosynthesis makes oxygen AND bacteria like oxygen AND bacteria concentrate around blue and red spots → photosynthesis is going on these blue and red spots → photosynthetic pigment accepts blue and red (but not green) → photosynthetic pigment IS green.

Next lab

Please bring the printed tree manual.

15 Photosynthesis

15.1 History

Blackman

- In 1905, Frederick Blackman discovered that if light intensity is low, increase of temperature has a little effect on the rate of photosynthesis
 1. If light and temperature were *independent*, this could not happen
 2. If temperature and light were *components of the chain*, than light was first and temperature second
- Consequently, photosynthesis has two stages:
 1. Light stage which relates more with light intensity
 2. “Dark” (now called *enzymatic*) stage which relates more with temperature

Light and enzymatic (“dark”) reactions

- Light reactions depend on the light and water, they produce oxygen and energy (in form of ATP)
- Enzymatic reactions depend on carbon dioxide and water, they take energy from light reactions and result in production of carbohydrates

Four equations of photosynthesis

1. $6\text{CO}_2 + 6\text{H}_2\text{O} \xrightarrow{\text{light}} \text{C}_6\text{H}_{12}\text{O}_6 + 6\text{O}_2$ is *not a formula*, but merely a general description of a process
2. Water molecules arise from both sides, and the better formula is $6\text{CO}_2 + 12\text{H}_2\text{O} \xrightarrow{\text{light}} \text{C}_6\text{H}_{12}\text{O}_6 + 6\text{H}_2\text{O} + 6\text{O}_2$
or even
3. carbon dioxide + hydrogen donor $\xrightarrow{\text{light}}$ carbohydrate + water + oxidized hydrogen donor
4. And the best one is probably $\text{CO}_2 + \text{H}_2\text{O} \xrightarrow{\text{light}} \text{carbohydrates} + \text{H}_2\text{O} + \text{O}_2$

15.2 Light stage: electron transport, synthesis of ATP and NADPH

Participants of light stage

1. Chlorophyll (photosystems II and I)
2. Light
3. Water
4. ATP synthase (ATPase)
5. Protons (H^+)
6. Hydrogen carrier (NADP^+)

Where: around thylakoid membrane

Logic of the light stage

1. To assemble carbon dioxide into sugar, we need ATP
2. To make ATP, we need *electrical current* through the proton pump
3. To make this current, we need the *difference in charge* (voltage difference) between thylakoid and matrix (stroma) compartments
4. To make this difference, we need to *segregate ions*: positively charged (like H^+) will go from outside and stay inside, negatively charged (like e^- and OH^-) will go from inside and stay outside
5. To segregate ions, we need the energy and the energy booster. These are sun rays and chlorophyll

Why chlorophyll is good for the membrane

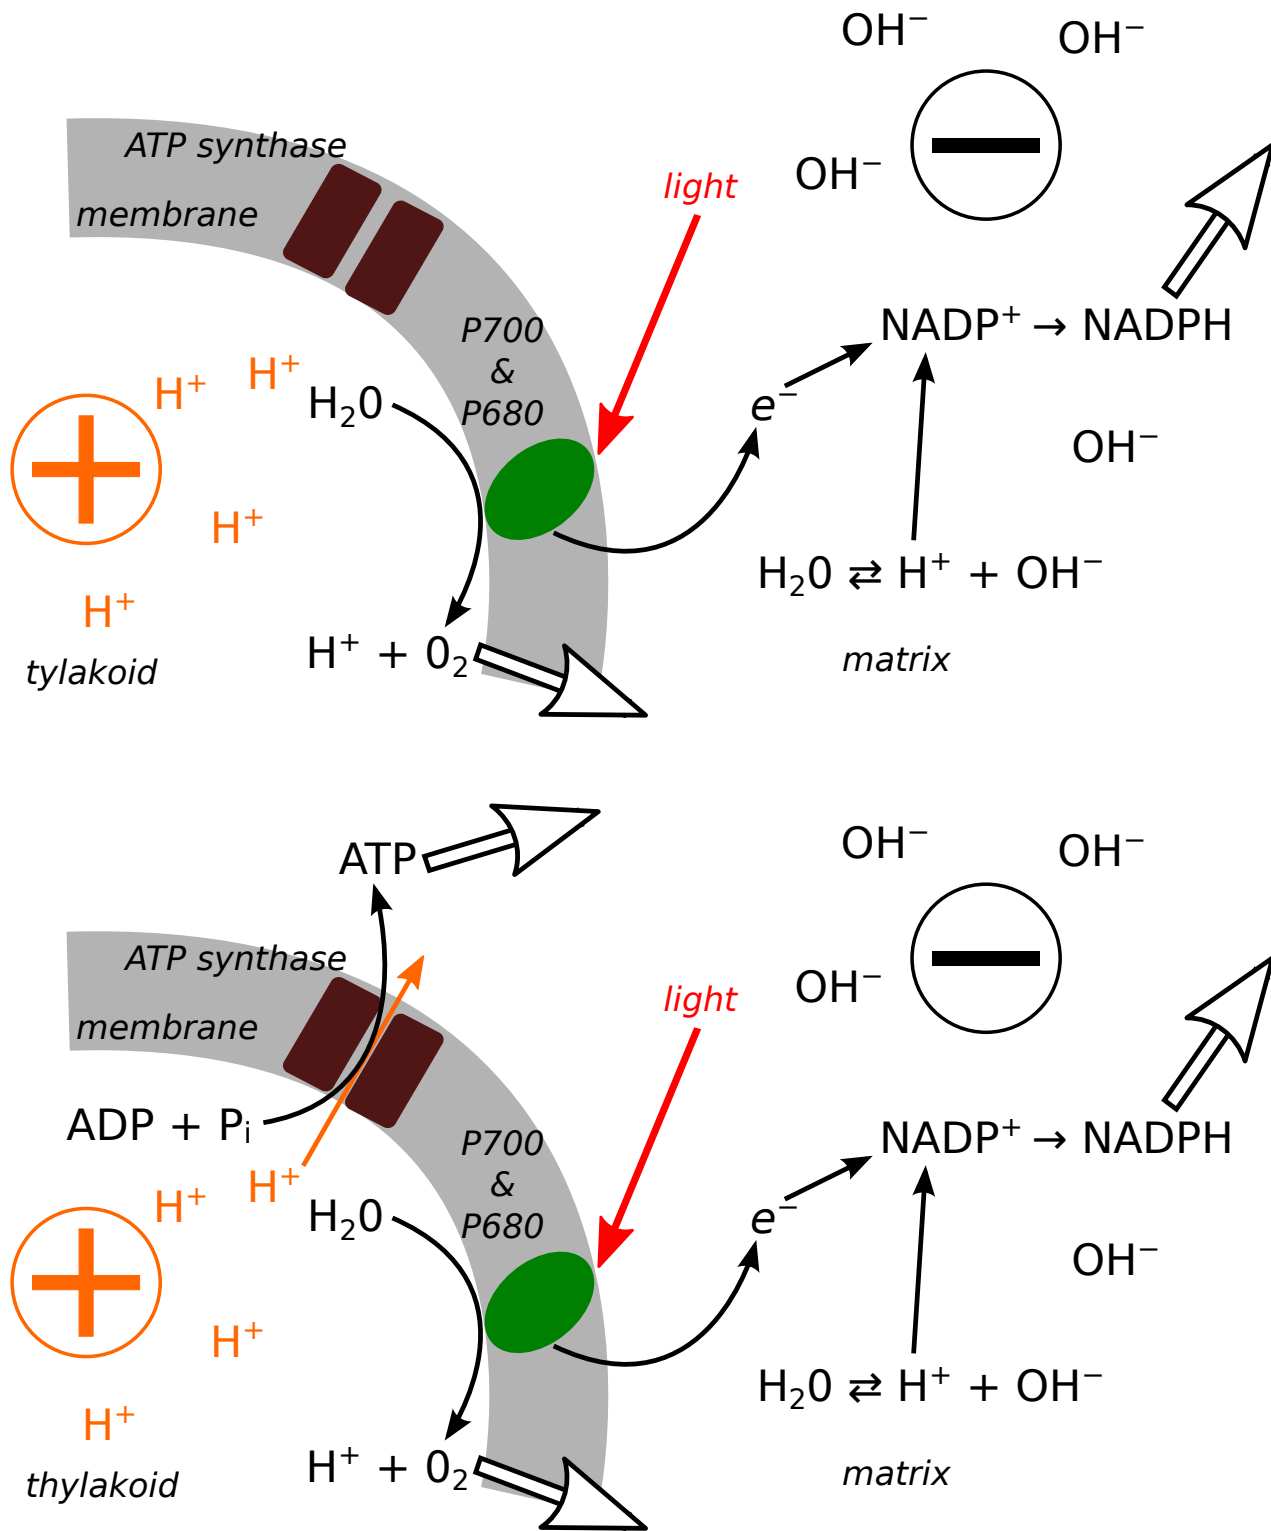

How chlorophyll works: excitation of the electron

Scheme of light stage

Main events of light stage

1. Chlorophyll + Light \longrightarrow Electron (e^-) + Chlorophyll $^+$
2. $e^- + H^+$ (from water) + Hydrogen carrier ($NADP^+$) \longrightarrow NADPH (moves away)
3. $H_2O \longrightarrow H^+$ (accumulates inside) + $e^- + O_2$

4. H^+ (inside) + OH^- (from water, located outside) \Rightarrow gradient \Rightarrow proton pump \Rightarrow H_2O TOGETHER WITH $\text{ADP} + \text{P}_i$ (inorganic phosphate) \rightarrow **ATP**

Photosystems

- Photosystem II (P_{680} , contains chlorophylls and carotene):
 1. decomposes water;
 2. forwards electron to Photosystem I;
 3. makes proton gradient
- Photosystem I (P_{700} , contains only chlorophylls) makes NADPH

Photosystems movie

Results of the light stage

At the start	At the end
H_2O	H_2O (result of pump) and O_2
Chlorophylls	Chlorophylls
ADP and P_i (inorganic phosphate)	ATP
NADP^+	NADPH

Final question (2 points)

Explain the role of NADP^+

Summary

- **Photosynthesis** is a sum of light-dependent and light-independent reactions
- **Light stage** of photosynthesis results in accumulation of energy and hydrogen, and release of oxygen

For Further Reading

Example questions for the exam

Start time _____

End time _____

Short answers

1. Why do carnivorous plants catch insects? Explain. (*4 points*)

Multiple choice

Every question in this section costs either 2 or 0. Please **mark** the appropriate answer on the **scantron**.

- | | |
|---|--|
| 1. Which set of three components can make a amino acid? | (a) Carbon dioxide |
| (a) Oxygen, hydrogen, nitrogen and carbon skeleton | (b) Oxygen |
| (b) Phosphoric acid, sugar and carbon cycle with nitrogen | (c) More water |
| (c) Lipids and nitrogen | 3. Dodder is: |
| 2. In photosynthesis, water used to make: | (a) Plant ₁ (ecological definition) and plant ₂ (taxonomic definition) |
| | (b) Plant ₁ only |
| | (c) Plant ₂ only |

(answers on next page)

Answers: 1A, 2B, 3C
