

Introduction to Botany. Lecture 13

Alexey Shipunov

Minot State University

September 27, 2017

Outline

1 Questions and answers

- Quiz

2 Plant cell

- Cell boundaries
- Protein synthesis
- Other cell structures

3 Mitosis and meiosis

- Mitosis

Outline

1 Questions and answers

- Quiz

2 Plant cell

- Cell boundaries
- Protein synthesis
- Other cell structures

3 Mitosis and meiosis

- Mitosis

Questions and answers

Quiz

Final question (2 points)

Name 2 differences between animal and plant cells.

Final question (2 points)

Name 2 differences between animal and plant cells.

- Cell wall
- Vacuole
- Size
- Cell wall
- Plasmodesmata

Plant cell

Cell boundaries

Vacuoles, osmosis and turgor pressure

- If cell vacuoles contain more concentrated solution of salts then water surrounding cell (i.e., water outside is *hypotonic*), water will flow inside a cell. It is called **osmosis**
- Cell wall prevents cell from explosion due to high **turgor pressure**
- When water flows outside a cell, cell content will shrink: this is **plasmolysis**

Symplast and apoplast

- **Symplast**—name for continuous cytoplasm in set of cells
- **Apoplast**—space outside cell; area of considerable metabolic activity

Endoplasmic reticulum (network), ER

Rough endoplasmic reticulum with ribosomes along outer surface. Manufactures many proteins destined for secretion or for incorporation into membranes (TEM)

Golgi apparatus (dictyosomes)

The Golgi is an organelle composed of stacks of flattened, membranous sacs mainly responsible for modifying, packaging, and sorting proteins that will be secreted or targeted to other organelles of the internal membrane system or to the plasma membrane

Golgi apparatus on TEM

Golgi complex and smooth endoplasmic reticulum in a liver cell (TEM)

Plant cell

Protein synthesis

Nucleus structure

Nuclear envelope Double layered membrane, filaments of protein lamin line inner surface and stabilize structure, inner and outer membranes connect to form pores

Nucleoplasm Portion inside the nuclear envelope

Nucleoli Dark staining bodies within nucleus, site for ribosome synthesis

Chromosomes Store genetic information in nucleotide sequences, each chromosome consists of chain of nucleosomes (long DNA molecule and associated histone proteins). When cell is not dividing, chromosomes are frequently seen as **chromatin**.

Nucleus

A typical nucleus with a prominent nucleolus (TEM).

Nuclear pores

Freeze-fracture technique used to show nuclear pores. Nuclear pores are structures in the nuclear envelope that allow passage of certain materials between the cell nucleus and the cytoplasm (TEM $\times 100,000$)

Nuclear pores and envelope

Ribosomes

Plant cell

Other cell structures

Cellular skeleton

Collection of long, filamentous structures within cytoplasm:

- **Microtubules.** Movement based on tubulin-kinesins interactions. They are key organelles in cell division, form basis of cilia and flagella, serve as guides for the construction of cell wall
- **Microfilaments.** Movement based on actin-myosin interactions. Serve as guides for movement of organelles within cell

Cytoskeleton

© 2006 Brooks/Cole - Thomson

Mitosis and meiosis

Mitosis

Definition of mitosis

- *Equal cell division, where each of daughter cells receives the same number of chromosomes as a mother cell*
- Chromosome formula: $X \longrightarrow I + I$
- **The goal of mitosis** is the equal distribution of pre-synthesized DNA
- Mitosis does not change genotype of cells

Mitosis, karyokinesis and cytokinesis

- Mitosis is the kind of nucleus division, **karyokinesis**
- Cytokinesis is a different process, the part of **cell cycle**

Cell cycle

- Interphase

- Pre-synthetic stage (G₁)
- Synthetic stage (S): DNA duplicated
- Post-synthetic stage (G₂)

- Mitosis

- Prophase
- Metaphase
- Anaphase
- Telophase

- Cytokinesis

Stages of mitosis

- Prophase
- Metaphase
- Anaphase
- Telophase

Final question (2 points)

Final question (2 points)

Which stage?

Summary

- Eukaryotic and prokaryotic cells are cells of different levels of organization
- Eukaryotic cell is a “second-level” cell, cell from cells, ecosystems
- Chloroplasts and mitochondria are both results of symbiogenesis
- Secondary cell walls cover dead cells
